Blockchain

[NOTE] Important Note: This PDF contains sample questions with complete answers and explanations. **Visit SolveMyQues.com** for our complete question bank, interactive tests, and detailed performance tracking!

Question 1:

Explain blockchain technology with a simple example of how blocks are connected.

[ANSWER] Answer & Explanation:

Blockchain is a distributed digital ledger that stores data in blocks linked together using cryptographic hashes.\n\n**Basic Structure:**\n\nBlock 1 (Genesis):\n- Data: "Alice sends 10 coins to Bob"\n- Hash: 0x1a2b3c...\n- Previous Hash: 0x000000...\n\nBlock 2:\n- Data: "Bob sends 5 coins to Charlie"\n- Hash: 0x4d5e6f...\n- Previous Hash: 0x1a2b3c... (Block 1 hash)\n\n**Key Properties:**\n• **Immutable** - Changing any block breaks the chain\n• **Decentralized** - No single point of control\n• **Transparent** - All transactions are visible\n• **Secure** - Cryptographically protected\n\n**Simple Example:**\nImagine a notebook shared among friends where:\n- Each page (block) contains transaction records\n- Every page references the previous page number (hash)\n- If someone tries to modify an old page, everyone notices because the page numbers do not match\n- Everyone has a copy, so no single person can cheat\n\nThis creates an unbreakable chain of records that everyone can trust without needing a central authority.

Question 2:

Explain cryptocurrency and its key differences from traditional digital payments.

[ANSWER] Answer & Explanation:

Cryptocurrency is digital money that uses cryptography for security and operates on blockchain networks without central authority.\n\n**Traditional Digital Money (Bank Transfer):**\nAlice ? Bank ? Bob\n- Bank verifies Alice has $100\n- Bank deducts $100 from Alice\n- Bank adds $100 to Bob\n- Bank maintains central ledger\n\n**Cryptocurrency Transaction:**\nAlice ? Blockchain Network ? Bob\n- Alice signs transaction with private key\n- Network nodes verify signature and balance\n- Transaction added to blockchain\n- No central authority needed\n\n**Key Differences:**\n\n| Aspect | Traditional Digital | Cryptocurrency |\n|--------|-------------------|----------------|\n| Control | Central bank/authority | Decentralized network |\n| Verification | Bank validates | Network consensus |\n| Reversibility | Can be reversed | Irreversible |\n| Privacy | Bank knows all details | Pseudonymous |\n| Availability | Business hours | 24/7/365 |\n| Borders | Geographic restrictions | Global |\n| Fees | Bank fees | Network fees |\n\n**Example Cryptocurrencies:**\n• **Bitcoin (BTC)** - Digital gold, store of value\n• **Ethereum (ETH)** - Smart contract platform\n• **Litecoin (LTC)** - Faster Bitcoin alternative\n\n**Benefits:** No intermediaries, global access, programmable money, censorship resistance

Question 3:

Explain the process of creating and verifying digital signatures with an example.

[ANSWER] Answer & Explanation:

Digital signatures use public-key cryptography to prove transaction authenticity without revealing private keys.\n\n**Key Generation Process:**\n1. Generate random private key (256-bit number)\n Private Key: d = 0x1234567890abcdef...\n\n2. Calculate public key using elliptic curve\n Public Key: Q = d × G (where G is generator point)\n Q = (x, y) coordinates on curve\n\n3. Create wallet address from public key\n Address = Hash(Public Key)\n\n**Transaction Signing Process:**\nStep 1: Create transaction\ntx = {\n from: "1A1zP1eP5QGefi2DMPTfTL5SLmv7DivfNa",\n to: "1BvBMSEYstWetqTFn5Au4m4GFg7xJaNVN2", \n amount: 0.5,\n fee: 0.001\n}\n\nStep 2: Hash transaction data\ntxHash = SHA256(tx) = 0xabc123...\n\nStep 3: Sign with private key\nsignature = sign(txHash, privateKey)\n\nStep 4: Broadcast transaction + signature\n\n**Verification Process:**\nStep 1: Receive transaction + signature\nStep 2: Hash transaction data\nStep 3: Verify signature using public key\nif (verify(signature, txHash, publicKey) == true) {\n transaction_valid = true\n} else {\n transaction_invalid = true\n}\n\n**Security Properties:**\n• **Authentication** - Proves sender identity\n• **Non-repudiation** - Sender cannot deny signing\n• **Integrity** - Detects any data tampering\n• **Unforgeable** - Cannot create valid signature without private key\n\n**Real-world Analogy:** Like a handwritten signature, but mathematically impossible to forge and can be verified by anyone.

Question 4:

Explain how blockchain wallets work and the difference between hot and cold wallets.

[ANSWER] Answer & Explanation:

A blockchain wallet does not actually store cryptocurrency - it stores private keys that control access to funds on the blockchain.\n\n**How Wallets Work:**\nWallet Components:\n ??? Private Keys (secret, never shared)\n ??? Public Keys (derived from private keys)\n ??? Addresses (derived from public keys)\n ??? Transaction History (queried from blockchain)\n\nExample:\nPrivate Key: 5KJvsngHeMpm884wtkJNzQGaCErckhHJBGFsvd3VyK5qMZXj3hS\nPublic Key: 04678afdb0fe5548271967f1a67130b7105cd6a828e03909a67962e0ea1f61deb649f6bc3f4cef38c4f35504e51ec112de5c384df7ba0b8d578a4c1BvBMSEYstWetqTFn5Au4m4GFg7xJaNVN2\n\n**Wallet Types:**\n\n**1. Hot Wallets (Connected to Internet):**\n• **Web Wallets** - MetaMask, MyEtherWallet\n• **Mobile Apps** - Trust Wallet, Coinbase Wallet\n• **Desktop Software** - Electrum, Exodus\n• **Advantages** - Convenient, easy to use\n• **Disadvantages** - Vulnerable to hacking\n\n**2. Cold Wallets (Offline Storage):**\n• **Hardware Wallets** - Ledger, Trezor\n• **Paper Wallets** - Private keys printed on paper\n• **Air-gapped Computers** - Never connected to internet\n• **Advantages** - Maximum security\n• **Disadvantages** - Less convenient for frequent use\n\n**Seed Phrase Example:**\nMnemonic (12-24 words):\n"abandon ability able about above absent absorb abstract absurd abuse access accident"\n\nThis generates:\n- Master Private Key\n- Hierarchical Deterministic (HD) wallet structure\n- Multiple addresses from single seed\n\n**Security Best Practices:**\n• Never share private keys or seed phrases\n• Use hardware wallets for large amounts\n• Keep multiple backups in secure locations\n• Verify addresses before sending transactions\n• Use strong passwords and 2FA\n\n**Important:** "Not your keys, not your coins" - only control funds if you control private keys.

Question 5:

Explain the mining process with a practical example of how miners compete to add blocks.

[ANSWER] Answer & Explanation:

Mining is the process where computers compete to solve mathematical puzzles to validate transactions and secure the blockchain network.\n\n**Mining Process Step-by-Step:**\n\n**Step 1: Collect Transactions**\nMempool (pending transactions):\n- Alice ? Bob: 2 BTC\n- Charlie ? Dave: 1.5 BTC \n- Eve ? Frank: 0.8 BTC\n- Total fees: 0.05 BTC\n\n**Step 2: Create Block Header**\nBlock Header:\n{\n "previousHash": "0000a1b2c3d4e5f6...",\n "merkleRoot": "abc123def456...",\n "timestamp": 1640995200,\n "difficulty": "0000000000000000001a...",\n "nonce": 0\n}\n\n**Step 3: Mining Competition**\nTarget: Hash must start with 19 zeros\nMiners try different nonce values:\n\nMiner A tries nonce = 1:\nSHA256(blockHeader) = 1a2b3c4d... ? (does not start with enough zeros)\n\nMiner A tries nonce = 2:\nSHA256(blockHeader) = 9f8e7d6c... ?\n\nMiner B tries nonce = 1,847,293:\nSHA256(blockHeader) = 00000000000000001abc... ? WINNER!\n\n**Step 4: Broadcast Solution**\nWinning miner broadcasts:\n- Valid block with correct nonce\n- Network verifies solution\n- Block added to blockchain\n- Miner receives reward: 6.25 BTC + 0.05 BTC fees\n\n**Why Mining is Necessary:**\n\n**1. Security:**\n- Makes network attack expensive (need 51% of computing power)\n- Cost to attack > potential profit\n\n**2. Decentralization:**\n- No central authority decides which transactions are valid\n- Distributed consensus through competition\n\n**3. Incentivization:**\n- Miners earn rewards for maintaining network\n- Economic incentive ensures network operation\n\n**4. Fair Distribution:**\n- New coins distributed through work, not favoritism\n- Anyone can participate with computing power\n\n**Mining Difficulty Adjustment:**\nEvery 2016 blocks (~2 weeks):\nif (actual_time 2_weeks) {\n increase_difficulty() // blocks found too fast\n} else if (actual_time > 2_weeks) {\n decrease_difficulty() // blocks found too slow\n}\n\n**Energy Consumption Trade-off:**\nHigh energy use = High security. The electricity cost makes attacks economically unfeasible.
